**Cristina Isabel Cid (40318338)**

**AI Logs SOEN341 Sprint 2**

**Task 1:** Profile page with resume management

**Purpose of AI Use:** To understand how to build and managing resumes and user profile information.

**Chat Link or Prompt/Response:**

"Walk me through the steps on how to create the resume management in React for frontend: users should be able to upload, replace and manage resumes, and see their uploaded resumes and profile information. My profile includes personal info (first and last name, title, email, phone, location, bio, profile picture) and professional info (resume, work experience, education, skills)."

**AI-Suggested Content:** Suggested a React component structure, resume upload and replacement functionality, API service functions, profile editing forms, and management of work experience, education, and skills.

**Validation:** Reviewed the suggested code and workflow for relevance, file validation, and data persistence requirements.

**Decision:** Modified before using

**Reflection:** AI helped me organize the development process and identify the main features.

**Responsible Person:** Cristina Isabel Cid

**Task 2:** Job application form with a submission confirmation page

**Purpose of AI Use:** To get guidance on building a job application form and submission confirmation page.

**Chat Link or Prompt/Response:**

"Walk me through the steps for the job application form with a submission confirmation page for the front end in React."

**AI-Suggested Content:** React components for the application form and confirmation page, form validation, resume upload, state management using useState, and CSS styling.

**Validation:** Reviewed the suggested design and checked the form flow, required fields and confirmation screen.

**Decision:** Modified before using

**Reflection:** It helped me understand the structure and workflow of the application. I reviewed and adapted the suggestions to meet my project requirements and improve my understanding of React.

**Responsible Person:** Cristina Isabel Cid

**Task 3:** My Applications page with status tracking

**Purpose of AI Use:** To get guidance on structuring the My Applications page including a progress tracker, application status updates and filtering options.

**Chat Link or Prompt/Response:**

"Walk me through how to structure the applications page with a progress tracker for the front end in React. Users should track application status (Applied, Under Review, Interview, Offered, Rejected)."

**AI-Suggested Content:** The AI suggested building the page with reusable React components, including ApplicationCard, ProgressTracker, StatusBadge, StatusFilter, and SummaryCards. It recommended using React state to manage application statuses, filtering applications by status, and displaying summary statistics such as total applications, interviews, and offers. It also suggested using CSS to visually distinguish completed, active, and upcoming stages, while displaying rejected applications as a separate terminal state.

**Validation:** The suggestions were reviewed for relevance to the project requirements. The proposed component structure, state management approach, and status-filtering logic were considered appropriate for implementing the front end. The distinction between rejected applications and the regular progress stages was also reviewed to ensure the tracker accurately represents application outcomes.

**Decision:** Modified before using

**Reflection:** The AI provided a useful starting point for organizing the My Applications page and breaking the interface into manageable components. Its suggestions helped clarify how application statuses, progress indicators, filters, and summary cards could work together.

**Responsible Person:** Cristina Isabel Cid

**Task 4:** Create sample (mock) data so the frontend can be tested without the backend

**Purpose of AI Use:** Coding, testing

**Chat Link or Prompt/Response:**

"Could you provide fake sample data while the backend is still not finished so that I could test my front end?"

**AI-Suggested Content:** A mockStore.js file holding a sample profile, resumes, jobs and applications saved in the browser, used only by a new npm run dev:mock command that also logs in a demo user. All pages call the real backend routes through services/ files, so npm run dev uses the real backend and never the sample data.

**Validation:** Ran npm run dev:mock locally in VS Code and clicked through every page; edited mockStore.js and checked the changes appeared after resetting

**Decision:** Modified before using

**Reflection:** It was useful as I could build and demo my pages before the backend existed. I learned to keep fake data in one separate file so it never mixes with real data.

**Responsible Person:** Cristina Isabel Cid
