AI Logs SOEN341 Sprint 1

Activity 1 — Supabase Database and Authentication Setup

Task ID/Title: Set up Supabase database and authentication for user registration/login.

Purpose of AI Use: Requirements analysis and technical guidance. AI was used to determine the appropriate Supabase database structure and authentication setup for the CareerConnect registration and login features.

Chat Link or Prompt/Response:

Prompt: “Now I gotta write the pull request on GitHub. How to answer [PR template]?”
Additional prompts were used to clarify whether the work should be considered a task or user story and to create the corresponding GitHub issue.

AI-Suggested Content:

AI recommended using Supabase Authentication for user accounts instead of creating a custom password table. It suggested creating a profiles table containing the user's UUID, first name, last name, email, and creation date. It also suggested enabling Row Level Security and creating policies to ensure users can only access or modify their own profile.

Validation: The proposed database structure and security policies were manually reviewed against the project's login and registration requirements and configured through the Supabase interface.

Decision: Modified before use.

Reflection: AI assistance was useful for understanding how Supabase Authentication and the profiles table should work together. The suggestions provided a starting structure, but the configuration was manually reviewed and adjusted to match the project's requirements.

Responsible Person: Mujdeh Hosein Ali

Activity 2 — User Story Creation

Task ID/Title: Create user story for user registration.

Purpose of AI Use: Requirements analysis and documentation. AI was used to convert the technical implementation requirements into a user-focused user story with acceptance criteria.

Chat Link or Prompt/Response:

Prompt: “Ok now write user story i could write.”

AI-Suggested Content:

AI suggested the following user story:

“As a job seeker, I want to create an account using my personal information so that I can securely access CareerConnect and manage my profile and job applications.”

AI also proposed acceptance criteria covering registration information, validation, account creation, authentication, profile association, and error handling.

Validation: The user story and acceptance criteria were manually compared with the CareerConnect registration requirements and the intended functionality of the system.

Decision: Modified before use.

Reflection: AI assistance was useful for distinguishing between a technical task and a user story. The interaction helped translate the database/authentication implementation into a user-focused requirement that can be connected to multiple technical tasks.
