Name: Hatem Ibrahim

Student ID: 40265641

Reconstructed prompts and assistance summaries based on Sprint 2 database topics; not verified chat transcripts.

Task 1: Understanding S3 Buckets for Resume Storage

Purpose of AI Use

Technical explanation of object storage and how uploaded resume PDFs relate to SQL database records.

Chat Prompt/Response

Prompt 1:

Can you explain what an S3 bucket is and why we would store uploaded resume PDFs there instead of directly inside our SQL database?

AI-Suggested Content

AI explained buckets, objects, object keys, and the difference between storing files in object storage and storing structured metadata in SQL.

Reflection

This clarified why the database can store a reference to a resume while the actual PDF remains in separate storage.

Responsible Person

Hatem Ibrahim

Task 2: Connecting PDF Uploads to Database Records

Purpose of AI Use

Database modeling for uploaded resumes and their associated user records.

Chat Prompt/Response

Prompt 1:

When a user uploads a resume PDF, what information should we save in the database so we can retrieve the correct file later?

AI-Suggested Content

AI discussed storing a user identifier, storage object key, original filename, file type, upload time, and optional file size instead of storing the PDF bytes in a table.

Reflection

The discussion helped identify which metadata can connect each uploaded document to its owner.

Responsible Person

Hatem Ibrahim

Task 3: Protecting Uploaded Resumes

Purpose of AI Use

Understanding authorization and secure access to user-uploaded documents.

Chat Prompt/Response

Prompt 1:

How can we make sure users can only access their own uploaded PDF resumes when using an S3 bucket?

AI-Suggested Content

AI explained private buckets, checking ownership on the backend, and using short-lived signed URLs for authorized downloads.

Reflection

This helped distinguish file storage permissions from the database checks needed to verify which user owns a resume.

Responsible Person

Hatem Ibrahim

Task 4: Designing Application Tracking Statuses

Purpose of AI Use

Database design for application tracking lists and consistent status values.

Chat Prompt/Response

Prompt 1:

For an application tracking feature, should statuses like Applied, Under Review, Interview, Offer, and Rejected be stored as text or in a separate database table?

AI-Suggested Content

AI compared constrained text values with a separate status lookup table, including their impact on consistency, maintenance, and future changes.

Reflection

The comparison clarified how to keep application status values consistent across user records.

Responsible Person

Hatem Ibrahim

Task 5: Relating Applications to Users and Jobs

Purpose of AI Use

Understanding relational database design for users, applications, and job postings.

Chat Prompt/Response

Prompt 1:

Can you explain how foreign keys would work if each user can save multiple job applications and each application belongs to a job posting?

AI-Suggested Content

AI explained one-to-many relationships, foreign keys, and how user and job identifiers can link application records without duplicating information.

Reflection

This helped explain how relational constraints keep applications associated with valid users and job postings.

Responsible Person

Hatem Ibrahim

Task 6: Tracking Changes to Application Status

Purpose of AI Use

Understanding how to preserve changes to application statuses over time.

Chat Prompt/Response

Prompt 1:

If an application changes from Under Review to Interview, how could we keep a history of the changes instead of only saving the current status?

AI-Suggested Content

AI described using a separate status-history table containing an application identifier, previous and new statuses, a timestamp, and optional notes.

Reflection

This clarified the difference between the current application status and a history of earlier changes.

Responsible Person

Hatem Ibrahim

Task 7: Avoiding Duplicate Applications

Purpose of AI Use

Database constraint planning for application tracking records.

Chat Prompt/Response

Prompt 1:

How can we prevent a user from accidentally adding the same job application more than once to their tracking list?

AI-Suggested Content

AI explained unique constraints and possible composite keys, while noting that the application rules must determine whether repeated applications are allowed.

Reflection

This helped explain how database constraints can prevent unintended duplicate tracking records.

Responsible Person

Hatem Ibrahim

Task 8: Verifying Uploaded Documents and Application Records

Purpose of AI Use

Planning database and storage verification for user-owned resumes and tracked applications.

Chat Prompt/Response

Prompt 1:

What SQL queries or dashboard checks can I use to confirm that a resume upload and a new tracked application are linked to the correct user?

AI-Suggested Content

AI explained checking user identifiers and foreign keys with read-only SQL queries, then separately verifying the stored file metadata.

Reflection

This helped distinguish database record verification from confirming that the uploaded file exists in object storage.

Responsible Person
