AI Logs SOEN341 Sprint 1

Task 1: Generate 10 User Stories

Purpose of AI Use: Used AI to generate 10 set of user stories and implementation tasks based on the CareerConnect project requirements.

Chat Link or Prompt/Response:

Could you generate 10 user stories with tasks based on the SOEN 341 Software Process Team Project Fall 2026 requirements for CareerConnect, a job search and application tracking platform [insert project description]?

AI-Suggested Content:

The AI generated 10 initial user stories covering features such as user registration, login, profile management, resume management, job search, recruiter job postings, job applications, application status tracking, saved jobs, and AI-assisted resume feedback. Each story was also divided into implementation tasks.

Validation: The team reviewed the generated user stories against the CareerConnect project description and Sprint 1 requirements. The stories were discussed and compared with the team's own understanding of the project requirements.

Decision: Modified before using

Reflection: The AI-generated stories were useful as a starting point for identifying possible system functionalities. Final user stories were created and modified based on the team's decision

Task 2: React Profile Management UI Structure

Purpose of AI Use: Used AI to understand how to structure and develop the front-end of a profile management UI using React as a beginner.

Chat Link or Prompt/Response:

Could you walk me through the steps on creating the front-end structure of a profile management UI using React?

AI-Suggested Content:

The AI suggested a basic React component structure for the profile management UI, including a main profile page, sidebar, profile form, avatar, and form sections. It also explained how these components could be organized and built incrementally.

Validation: The suggested structure was manually reviewed and compared with the requirements of the profile management UI to ensure it was appropriate and practical for the project.

Decision: Modified before using. The suggestions were used as guidance.

Reflection: The interaction helped clarify how a React interface can be divided into smaller reusable components and how React state can be used to manage form inputs. AI assistance was useful for understanding the initial structure and development process.
